

Addressing Perinatal HIV & Congenital Syphilis in NJ

Building Capacity to Improve Health Outcomes During Pregnancy

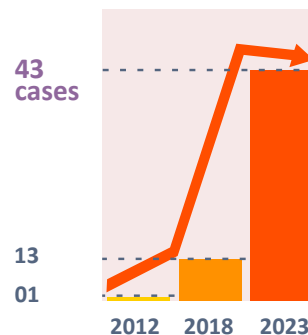

Syphilis is a growing concern in NJ

Cases of syphilis among women in NJ have been on the rise leading to a resurgence of congenital syphilis cases in our state.

Increase in acquired syphilis
(with a sharp incline since 2016)

Increase in congenital syphilis
(despite decreases in 2022-2023)

Among 15-44 Y.O. Females 2012-2023 | Source: NJDOH & CDC

Why is this critical?

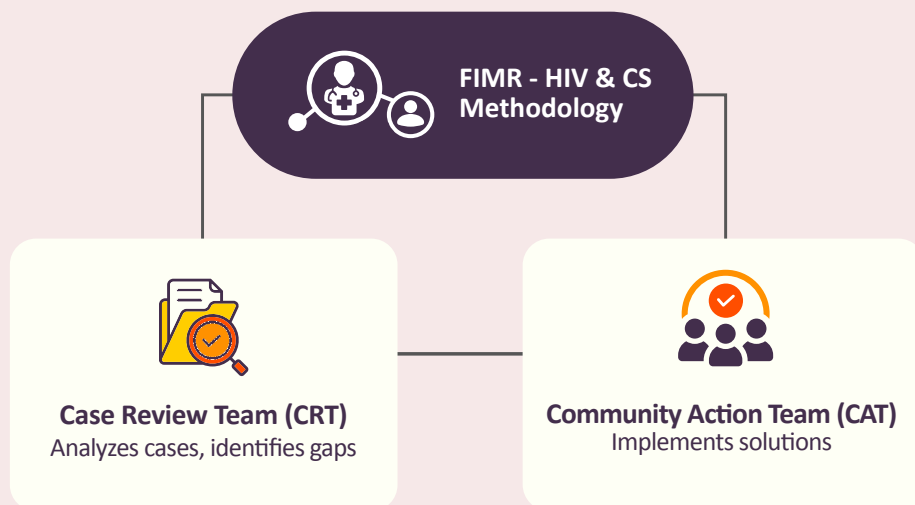

Serious Health Issues
may result if syphilis left untreated.

Severe Infant Health Complications
when transmitted during pregnancy.

The Fetal and Infant Mortality Review - HIV & Congenital Syphilis (FIMR - HIV & CS) Methodology

This methodology is designed to improve perinatal HIV & congenital syphilis prevention systems. It is a community-driven process to improve care. The Case Review Team and Community Action Team help to facilitate this process.

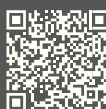

What is the goal?

Improve perinatal HIV and congenital syphilis prevention systems.
